**When washing fabric ducts of GreenWeave and MultiWeave materials for food industry or other installations with high demands on hygiene, the fabric duct should be turned inside out.**

1. The machine should only be filled to half capacity. Wash at 68-105°F with ordinary detergent for approx. 5-15 min. at a time until the washing water is totally clean.
2. Rinsing in several changes of water that is gradually cooled off.
3. In the second-last change of rinsing water a disinfectant (chlorine) may be added, if needed. Do not add fabric softener as this may lead to shrinkage and bad odour.
4. Dripping - light spin-drying or hanging on a line while still moist. Dripping is recommended, but tumble drying at low temperature (max. 140°F) can be effected, however, with risk of shrinkage.

**NOTE!**

**Fabric ducts with Ø2" Vario nozzles must be washed in a mesh laundry bag to avoid damaging the duct material.**
